Often, the problem can be solved by improving Speed, adding Multi-threading, viewing used memory, optimizing images, organizing data, controlling when to start exporting, connecting external storage drives when moving data, and adhering to caching technologies. If you want to speed up a program's performance, you can increase it's "process priority". On an Apple Macintosh, you do this using the Apple menu, Programs, and then opening up the Activity Monitor. If you don't have a Mac, you will have to use the Task Manager in Windows, which is outlined in this article as well (https://www.theaccidentalphotographer.com/2010/01/01/how-to-manually-track-the-processes-running-on-your-computer/). Other programs will have similar mechanisms for doing the same thing. The real benefit to using a faster computer is that Lightroom can take advantage of the extra resources. I do agree that Lightroom has outstanding import and exporting speeds in comparison with Photoshop. But I find that the workflow is not the same between both programs. I have to start by importing from a computer and connecting it to my iPad. Then, I have to make sure the iPad and computer are synced. If I am shooting a lot of images, I first have to create a catalog, attach it to a collection, and then name the collection. I can't just touch on "photos from the last Pixelmator App Development Meetup" and just create a new collection. And then, I don't find the import process from the newly created catalog as smooth as trying to import from a fresh catalog. Granted, I haven't had the opportunity to work with a lot of new Lightroom 5, perhaps even many of its former (previous) users are seeing fewer issues with new version. For a Lightroom 5 workflow that will be familiar to people who use Photoshop's CS4, I believe that we are still lacking a significant improvement. I mean, Lightroom is not the first program (or the only program, for that matter) to ship zero-interface image cataloging. I do believe that Lightroom is the only app to have traditionally encouraged you to add to a catalog using the keyboard. Yes, touch is helpful when installing or removing libraries, but quite frankly, we have a lot of data to sort through and organize. A keyboard is helpful when we are trying to follow an app's suggestions. I give the example of walking through a complex photo catalog looking for images. Is a keyboard preventing us from doing that? I don't think so. Is it stopping us from importing a specific Library that includes the images we have shot recently? Perhaps, but that is not a key part of Lightroom 5, anyway. So, if you are used to navigating a large catalog by following your mouse pointer, such as with Photoshop, then you may find that a few keystrokes can really make a difference. And, don't forget about what's on the right side of the app, too! Selecting images and sharing them over social media is also much more streamlined in Lightroom and I find it very convenient. On the other hand, merging two catalogs together (or any catalogs into one) is a task I find somewhat complicated.

If you need to cut a corner off your image and for some reason choose to crop your work, you'll have the ability to do so. If Photoshop detects a specific lens, you'll get information on whether the different focal lengths are sharp or not. These are all very useful for modifying a photo. HDR stands for High Dynamic Range image. When using this function, it has the ability to take a series of photographs and merge them into one. Most cameras either have this function or can be upgraded to make it happen. HDR images are great for many reasons, but the most obvious is that they can be used to bring out the best colors in a photo. In most cases they also create a much brighter look to the photo. While this is an often requested feature, you can create custom brushes. This means that you can add items (such as simple icons or text) and set them as masks. You can use these to create different color, physical or other filters. Add in, change and draw on the mask using the pen tool and in a matter of moments, you can create a photo filter. You'd be surprised how many photographers, even beginners, think of flash 25 times when really all they should do is print the shot and be done with it. That said, flash or flash drive has many uses outside of just being seen. The option to create a preset is very helpful to avoid having to fumble to find the exact controls to change the flash brightness. Each image has different flash characteristics. Because of this, it is hard to say you need a certain number and exposure settings to correct the exposure. 933d7f57e6
